

To know use of registers in Assembly language programming, take a program example.

```
ORG 100h
MOV AX, 0B800h
MOV DS, AX
MOV CL, 'A'
MOV CH, 1101_1111b
MOV BX, 15Eh
MOV [BX], CX
RET
```

What is h and b in this program ?

Number system :

Binary number (b) : 0,1

Hexadecimal number (h) : 0,1,2,3,4,5,6,7,8,9,A,B,C,D,E,F

What are AX, BX, etc. in this program ?

General Purpose Registers:

AX - Accumulator register | Divided in to AH and AL

BX - Base address register | Divided in to BH and BL

CX - Count register | Divided in to CH and CL

DX - Data register | Divided in to DH and DL

Segment Registers:

CS - Indicate the segment which contains current program

DS – Indicate the segment where variables are define

ES – Extra segment registers

SS – Indicate the segment containing stack.

Special Registers:

IP – Instruction pointer

Flag register – It determines the current status of microprocessor.

Example to understand use of AH and AL registers

Size of AX register is 16 bit.

That means,

AH = 8 bit

AL = 8 bit

AX = 0011000000011110b

AH = 00110000

AL = 00011110b
