

In C programming language, semicolon (;) is used to terminate a statement. However, it is possible to use the printf() function without using semicolon by placing the function call inside a code block and using a compound statement. Here is an example:

A dark-themed code editor window showing a C program. The code is as follows:

```
#include <stdio.h>
int main() {
    if (printf("Hello, world!\n")) {
        // do something else
    }
    return 0;
}
```

In this example, the printf() function call is inside an if statement, and the code block following the if statement serves as a compound statement that replaces the semicolon. When the program is executed, the message "Hello, world!" will be printed on the screen, followed by a newline character. The return value of printf() is used as the condition for the if statement, which will evaluate to true if the message is printed successfully.
