

Q4 Find  $k$  so that the quadratic equation  $x^2 - (k+3)x + k = 0$  has equal and real roots.

Solution:

Step 1 - For a quadratic  $ax^2 + bx + c = 0$  here  $a=1$ ,  $b=-(k+3)$ ,  $c=k$ .

Step 2 — Equal (repeated) real roots occur when the discriminant  $\Delta = b^2 - 4ac$  equals zero.

Compute:

$$\Delta = -(k+3)^2 - 4 \cdot 1 \cdot k = (k+3)^2 - 4k.$$

$$\Delta = k^2 + 6k + 9 - 4k = k^2 + 2k + 9.$$

Step 3 — Solve  $\Delta = 0$ . Set  $k^2 + 2k + 9 = 0$ . The discriminant of this quadratic in  $k$  is  $2^2 - 4 \cdot 1 \cdot 9 = 4 - 36 = -32 < 0$ , so there are no real solutions for  $k$ .

Conclusion: There is no real value of  $k$  that makes the original quadratic have equal real roots. (If complex  $k$  were allowed,  $k = -1 \pm 2i$ .)

Q.5 Form a quadratic equation with integral coefficients whose roots are  $2+\sqrt{5}$  and  $2-\sqrt{5}$ .

Solution:

Step 1 — If the roots are  $r_1 = 2+\sqrt{5}$  and  $r_2 = 2-\sqrt{5}$ , then

$$\text{sum} = r_1 + r_2 = (2+5) + (2-5) = 4,$$

$$\text{product} = r_1 r_2 = (2+5)(2-5) = 4-5 = -1.$$

Step 2 — A monic quadratic equation with these roots is

$x^2 - (\text{sum})x + (\text{product}) = x^2 - 4x - 1$ . Answer: quadratic equation is  $x^2 - 4x - 1 = 0$ . Its coefficients are integer.

---

Q.6 For roots  $\alpha, \beta$  of  $3x^2 - 7x + 2 = 0$ , compute  $\alpha^2 + \beta^2$ .

Solution:

Step 1 — For  $ax^2 + bx + c = 0$  we have  $\text{sum} = \alpha + \beta = -\frac{b}{a}$  and  $\text{product} = \alpha\beta = \frac{c}{a}$ . Here  $a=3, b=-7, c=2$ , so

$$\alpha + \beta = -\frac{-7}{3} = \frac{7}{3}, \alpha\beta = \frac{2}{3}.$$

Step 2 — By identity.

$$\alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta.$$

Substitute the values:

$$\alpha^2 + \beta^2 = \left(\frac{7}{3}\right)^2 - 2 \cdot \frac{2}{3} = \frac{49}{9} - \frac{4}{3} = \frac{49}{9} - \frac{12}{9} = \frac{37}{9}.$$

convert to a common denominator:

$$499 - 129 = 379.$$

Answer :  $\alpha^2 + \beta^2 = 379.$
