Characteristics of an intranet versus the internet :

1. Users:

- Intranet:
  - Used by organization employees who know a lot about the company.
  - Users are familiar with the organization’s structure, products, and culture.
- Internet:
  - Used by customers and others who may not know much about the organization.
  - Users may have less interest or knowledge about the company.

2. Tasks:

- Intranet:
  - Used for everyday activities within the organization, including complex transactions and communications.
- Internet:
  - Mainly used to find information, with simple transactions as a secondary use.

3. Type of Information:

- Intranet:
  - Contains detailed information necessary for organizational functioning.
  - Information can be frequently added or modified.
- Internet:
  - Presents more stable information, such as marketing, customer/client information, and reports.

4. Amount of Information:

- Intranet:
  - Typically much larger than the organization’s public internet site.
  - Can be ten to one hundred times larger than the corresponding public site.
- Internet:
  - Contains a relatively smaller amount of information.

5. Hardware and Software:

- Intranet:
  - Operates in a controlled environment with restricted or standardized hardware and software.
  - Allows for faster performance due to less need for cross-platform compatibility.
- Internet:
  - Requires compatibility across various devices and platforms, leading to potentially slower performance.

6. Design Philosophy:

- Intranet:
  - Implements current text-based and GUI applications for a user-friendly experience.
- Internet:
  - May have more traditional GUI designs with visual appeal but without unnecessary promotional features.
  - Results in GUI hybrids that are richer and more effective for users.

Describe the characteristics of intranet versus the internet.
