

Describe the features of object-oriented languages ? OR Explain the major features of Object-Oriented Programming.

Features of object-oriented language are :

1. Encapsulation:

- What it means: Think of encapsulation like putting your data and the methods that operate on that data into a protective bubble.
- Easy way to understand: Imagine your data is a secret treasure, and only certain methods (keys) can access or modify that treasure. The treasure is safe inside its bubble, and only authorized methods can interact with it.
- Why it's useful: Keeps your data safe from unauthorized access, and it helps organize and manage your code better.

Describe the features of object-oriented languages ? OR Explain the major features of Object-Oriented Programming.

Message passing between objects with encapsulation activating methods that can user or modify the data within their object.

1. Polymorphism:

- What it means: Polymorphism is like having a magic wand that can transform into different shapes based on what you need.
- Easy way to understand: Suppose you have a message, and it can be displayed in various ways depending on the situation. It's like having a versatile tool that adapts to different needs.
- Why it's useful: Allows different objects to respond to the same message in their

own unique way, making your code more flexible and adaptable.

## 2. Inheritance:

- What it means: Inheritance is like passing down traits from parents to children.
- Easy way to understand: Imagine you have a super class (like a family tree), and you create new classes that inherit qualities (attributes and methods) from this super class. It's like the new classes are the children inheriting the family traits.
- Why it's useful: Saves you from repeating code. You can create a base class with common features, and new classes can inherit those features, adding or modifying them as needed.
