

In PHP, break and continue are control statements used in loops (such as for, while, and do-while) to alter the normal flow of execution.

## Break statement:

The break statement is used to terminate the current loop and continue executing the code outside of the loop. When break is encountered inside a loop, the loop will immediately exit, and the program execution will continue with the statement immediately following the loop.

For example:

```
for ($i = 0; $i < 10; $i++) {  
    if ($i == 5) {  
        break;  
    }  
    echo $i . "<br>";  
}
```

In this example, the loop will iterate 5 times, and when \$i is equal to 5, the break statement is encountered, causing the loop to exit.

The output of this code will be:

```
0  
1  
2  
3  
4
```

## Continue statement:

The continue statement is used to skip the current iteration of a loop and continue with the next iteration. When continue is encountered inside a loop, the current iteration will be skipped, and the program will continue with the next iteration of the loop.

For example:

```
for ($i = 0; $i < 10; $i++) {  
    if ($i == 5) {  
        continue;  
    }  
    echo $i . "<br>";  
}
```

In this example, when \$i is equal to 5, the continue statement is encountered, causing the loop to skip the current iteration and continue with the next iteration.

The output of this code will be:

```
0  
1  
2  
3  
4  
6  
7  
8
```

Both break and continue statements are useful when you want to control the flow of execution within a loop based on certain conditions.
