Relationship:

- A relationship describes how different parts of a system relate to each other.
- It’s a way to visually represent the connections and dependencies between elements in a model.
- They provide a clear understanding of how various components in a system work together.
- Relationships help in representing the structure and behavior of a system in a more comprehensive way.

Types of Relationship:

1. Dependency Notation:
    - What it does: Describes which elements in a UML model depend on each other.
    - Representation: Shown with a dotted arrow.
    - Arrow Head: Points to the element that is independent.
    - Use: Indicates a connection between two elements in a system.
2. Association Notation:
    - What it does: Describes how elements in a UML diagram are associated or connected.
    - Representation: Shown with a dotted line, possibly with arrows on both ends.
    - Ends of Line: Represent the associated elements.
    - Multiplicity: Indicates how many objects are connected (e.g., 1, *, etc.).
3. Generalization Notation:
    - What it does: Describes the inheritance relationship in an object-oriented world (parent and child relationship).
    - Representation: Shown with an arrow having a hollow arrowhead.

- Ends of Arrow: Represent the parent and child elements.

4. Extensibility Notation:
    - What it does: Enhances the capabilities of the UML language by allowing extensions in syntax, semantics, etc.
    - Mechanisms: Uses stereotypes (for new elements), tagged values (for new attributes), and constraints (for boundaries).
    - Use: Enables the language to adapt and extend its functionality.
