In PHP, there are several ways to repeat code, depending on the specific needs of your program. Here are some of the most common ways to repeat code in PHP:

Loops:

Loops allow you to repeat a block of code a certain number of times, or until a certain condition is met. There are three types of loops in PHP:

Executes a block of code a specified number of times.

```
for ($i = 0; $i < 10; $i++) {
  echo $i;
}</pre>
```

In this example, the loop will execute 10 times, with the \$i variable starting at 0 and incrementing by 1 each time through the loop.r

Executes a block of code as long as a specified condition is true.

```
$i = 0;
while ($i < 10) {
  echo $i;
  $i++;
}</pre>
```

In this example, the loop will execute as long as \$i is less than 10, with the \$i variable incrementing by 1 each time through the loop.

Executes a block of code at least once, and then continues to execute the code as long as a specified condition is true.

```
$i = 0;
do {
  echo $i;
  $i++;
} while ($i < 10);</pre>
```

In this example, the loop will execute at least once, and then continue to execute as long as \$i is less than 10, with the \$i variable incrementing by 1 each time through the loop.

Functions

Functions allow you to encapsulate a block of code that can be called multiple times with different inputs. You can define your own functions in PHP, or use built-in functions.

Here's an example of defining a function that squares a number:

```
function square($num) {
  return $num * $num;
}

echo square(4); // Outputs 16
echo square(6); // Outputs 36
```

In this example, the square function takes a single parameter \$num, multiplies it by itself, and returns the result. The function can be called multiple times with different input values.

Include/require

PHP also provides include and require statements that allow you to include a block of code from another file. This can be useful for repeating code that is used across multiple files in your program.

Here's an example:

```
// functions.php
function square($num) {
   return $num * $num;
}

// index.php
require 'functions.php';
echo square(4); // Outputs 16
echo square(6); // Outputs 36
```

In this example, the require statement includes the functions.php file, which defines the square function. The square function can then be called multiple times from within the index.php file.
