

How can we display data type information in PHP? Give example

In PHP, we can display data type information using the built-in `var_dump()` function. This function displays the type and value of a variable. It is particularly useful for debugging purposes, as it can help you identify the data type of a variable if you are unsure.

Here's an example:

```
$var1 = "Hello, world!";  
$var2 = 42;  
$var3 = true;  
  
var_dump($var1);  
var_dump($var2);  
var_dump($var3);
```

In this example, we have three variables of different data types: a string, an integer, and a boolean. We then use the `var_dump()` function to display the type and value of each variable.

The output will look like this:

```
string(13) "Hello, world!"  
int(42)  
bool(true)
```

From the output, we can see that `$var1` is a string with a length of 13, `$var2` is an integer with a value of 42, and `$var3` is a boolean with a value of true. The `var_dump()` function also tells us the data type of each variable.

How can we display data type information in PHP? Give example

Note that `var_dump()` outputs more information than just the data type, including the size of the variable in bytes and the actual value of the variable. This can be useful for debugging, but it may also be more information than you need. If you just want to display the data type of a variable, you can use the `gettype()` function instead.

For example:

```
$var = "Hello, world!";  
echo gettype($var);
```

This will output:

```
string
```
