Language Evaluation Criteria:

Some of the language criterias to evaluate a programming language are:

- 1. Readability
- 2. Writability
- 3. Reliability
- 4. Cost
- 5. Generality
- 6. Extensibility
- 7. Standardability
- 8. Support for internationalization
- 1. **Readability:** Coding should be simple and clear to understand.
 - 1. Simplicity: Should not involve complex syntax, many ways to perform a single task, overloading of methods and operator etc.
 - 2. Orthogonality: This means relatively small set of primitive constructs can be combine.
 - For ex., int *count; Here pointer and integer is combined.
 - Another ex., int count[5]; Here array and pointer is combine.
 - Control Statements: There should be adequate control statements.
 - Use of for loop, while loop, do while loop is adequate.
 - Using of go to statements causes poor readability.
 - 4. Data Types and Structures: Language should involve adequate facilities for defining data types and data structure.
 - For ex., timeout = 1; is unclear as compare to timeout = true;.
 - 5. Syntax Design: Syntax design affects the readability in the following way.
 - 1. *Identifier forms:* Restriction to very short length of identifier is a barrier to readability.
 - 2. Special words: Special words like while, for, class, int affects the

readability of any language. If special words are allowed to be variable names than it will become confusing.

- 2. **Writability:** Writability is a measure of how easily language can be used to code. Most of the language characteristics that affect readability also affect writability.
 - 1. Simplicity: Should not involve complex syntax, many ways to perform a single task, overloading of methods and operator etc.
 - 2. Orthogonality: This means relatively small set of primitive constructs can be combine.
 - For ex., int *count; Here pointer and integer is combined.
 - Another ex., int count[5]; Here array and pointer is combine.
 - 3. Support for Abstraction: Language should support process and data abstraction.
 - 4. Expressivity: In less lines of code program should be writable.
 - For ex., for statements makes counting loops easier than while.
 - Another ex., is i++ is more expressive than i=i+1.
- 3. **Reliability:** A program is said to be reliable if it performs to irs specifications under all conditions.
 - 1. Type Checking: It is testing for type error, either at compile or run time.
 - For ex., float percentage; is more desirable as compare to int percentage.
 - 2. Exception Handling: It is the ability of program to handle run time error. Remember, handling runtime error are more expensive than compile errors.
 - 3. Aliasing: It is same memory location (variable) having more than one name. Which is causes confusion.
 - 4. Readability: Readability influences reliability.
 - 5. Writability: Writability also influence reliability.
- 4. **Cost:** Total cost of programming should be minimum.
 - For ex., cost of trainer.
 - Cost of writing algorithm.

- Cost of compiling program in the language.
- Cost of hardware required for program.
- Cost of maintenance.
- 5. **Generality:** Language should not be limited to specific application only.
- 6. Extensibility: Should be flexible, must be able to add new constructs.
- 7. **Standardability:** Language should be platform independent.
- 8. Support for Internationalisation: Various formats like time, date, currency etc should be supportable.
