

1. What is the primary function of a fluid coupling in a mechanical system?

- a) To provide a direct mechanical connection between two shafts
- b) To transfer power between two rotating shafts while allowing for some degree of slip
- c) To amplify torque output in a gearbox
- d) To control the speed of a hydraulic system

Answer: b) To transfer power between two rotating shafts while allowing for some degree of slip

Explanation: A fluid coupling transfers torque from one shaft to another by fluid friction. It allows for some slip between the input and output shafts, providing a smooth start and gradual acceleration.

2. In a torque converter, what is the primary purpose of the stator?

- a) To transfer torque from the engine to the transmission
- b) To multiply torque output from the turbine to the output shaft
- c) To regulate the fluid flow within the torque converter
- d) To control the speed ratio between the input and output shafts

Answer: b) To multiply torque output from the turbine to the output shaft

Explanation: The stator redirects the fluid flow in a torque converter to increase torque multiplication, thus improving efficiency and performance.

3. What distinguishes positive displacement machines from turbo machines?

- a) Positive displacement machines operate on the principle of fluid inertia, while turbo machines rely on fluid viscosity.

- b) Positive displacement machines transfer a fixed volume of fluid per cycle, while turbo machines operate continuously.
- c) Positive displacement machines have a constant output torque, while turbo machines can vary torque output.
- d) Positive displacement machines are used exclusively in hydraulic systems, while turbo machines are used in pneumatic systems.

Answer: b) Positive displacement machines transfer a fixed volume of fluid per cycle, while turbo machines operate continuously.

Explanation: Positive displacement machines, like pumps, move a fixed volume of fluid per cycle, while turbo machines, like turbines and compressors, operate continuously and rely on dynamic principles for fluid transfer.

4. What is the primary advantage of a variable displacement pump compared to a fixed displacement pump?

- a) Variable displacement pumps offer higher efficiency at low speeds.
- b) Variable displacement pumps provide a constant flow rate regardless of operating conditions.
- c) Variable displacement pumps allow for adjustable output to match varying system requirements.
- d) Variable displacement pumps have simpler designs and lower maintenance requirements.

Answer: c) Variable displacement pumps allow for adjustable output to match varying system requirements.

Explanation: Variable displacement pumps can adjust their output flow rate to match the changing demands of a hydraulic system, providing flexibility and efficiency.

5. In a hydrostatic system, what is the function of an accumulator?

- a) To store hydraulic fluid for future use
- b) To regulate the pressure within the hydraulic system
- c) To absorb excess pressure and maintain system stability
- d) To control the flow rate of hydraulic fluid

Answer: c) To absorb excess pressure and maintain system stability

Explanation: Accumulators store hydraulic energy and absorb shocks or pressure spikes within the system, helping to maintain stable operating conditions.

6. What is the purpose of a hydraulic intensifier in a hydraulic system?

- a) To increase the pressure of hydraulic fluid
- b) To decrease the flow rate of hydraulic fluid
- c) To regulate the temperature of hydraulic fluid
- d) To filter contaminants from hydraulic fluid

Answer: a) To increase the pressure of hydraulic fluid

Explanation: Hydraulic intensifiers increase the pressure of hydraulic fluid to achieve higher force output, typically used in applications where high-pressure hydraulic power is required.

7. Which component in a hydraulic press is responsible for exerting force on the workpiece?

- a) Hydraulic cylinder
- b) Control valve
- c) Accumulator
- d) Hydraulic pump

Answer: a) Hydraulic cylinder

Explanation: The hydraulic cylinder in a press is responsible for exerting force on the workpiece by converting hydraulic pressure into linear mechanical force.

8. What distinguishes a positive displacement pump from a centrifugal pump?

- a) Positive displacement pumps are more energy-efficient than centrifugal pumps.
- b) Positive displacement pumps operate at higher speeds than centrifugal pumps.
- c) Positive displacement pumps provide a constant flow rate regardless of system pressure, while centrifugal pumps vary with pressure.
- d) Positive displacement pumps are only suitable for low-viscosity fluids, while centrifugal pumps can handle high-viscosity fluids.

Answer: c) Positive displacement pumps provide a constant flow rate regardless of system pressure, while centrifugal pumps vary with pressure.

Explanation: Positive displacement pumps deliver a fixed volume of fluid per cycle, maintaining a relatively constant flow rate, while centrifugal pumps' flow rates vary with changes in system pressure.

9. What is the primary advantage of a variable displacement pump over a fixed displacement pump in a hydraulic system?

- a) Variable displacement pumps offer higher efficiency at low speeds.
- b) Variable displacement pumps provide a constant flow rate regardless of system pressure.
- c) Variable displacement pumps allow for adjustable output to match varying system requirements.
- d) Variable displacement pumps have lower initial costs compared to fixed displacement

pumps.

Answer: c) Variable displacement pumps allow for adjustable output to match varying system requirements.

Explanation: Variable displacement pumps can adjust their output flow rate to match changing system demands, providing flexibility and energy savings.

10. In a hydraulic crane, what is the purpose of the hydraulic system?

- a) To control the stability of the crane
- b) To regulate the speed of the crane's movements
- c) To provide the lifting force and control the movement of the crane's components
- d) To adjust the height of the crane's boom

Answer: c) To provide the lifting force and control the movement of the crane's components

Explanation: The hydraulic system in a crane generates the lifting force and controls the movement of the crane's various components, enabling precise and efficient operation.

11. What is the primary function of a turbo machine in a fluid system?

- a) To transfer power between rotating shafts
- b) To amplify pressure or flow rate of the fluid
- c) To regulate the temperature of the fluid
- d) To filter contaminants from the fluid

Answer: b) To amplify pressure or flow rate of the fluid

Explanation: Turbo machines, such as turbines and compressors, increase the pressure or flow rate of a fluid by utilizing dynamic principles of fluid mechanics.

12. Which characteristic distinguishes a positive displacement pump from a centrifugal pump?

- a) Positive displacement pumps operate at higher speeds.
- b) Positive displacement pumps provide a constant flow rate regardless of system pressure.
- c) Positive displacement pumps are only suitable for high-viscosity fluids.
- d) Positive displacement pumps require less energy to operate than centrifugal pumps.

Answer: b) Positive displacement pumps provide a constant flow rate regardless of system pressure.

Explanation: Positive displacement pumps deliver a fixed volume of fluid per cycle, maintaining a relatively constant flow rate, unlike centrifugal pumps whose flow rates vary with pressure changes.

13. What is the primary purpose of a hydraulic accumulator in a hydraulic system?

- a) To regulate fluid temperature
- b) To store hydraulic fluid for future use
- c) To absorb pressure shocks and maintain system stability
- d) To control the direction of fluid flow

Answer: c) To absorb pressure shocks and maintain system stability

Explanation: Hydraulic accumulators store hydraulic energy and absorb pressure spikes, helping to maintain system stability and prevent damage.

14. What distinguishes a positive displacement machine from a turbo machine?

- a) Positive displacement machines operate continuously, while turbo machines operate

intermittently.

- b) Positive displacement machines transfer a fixed volume of fluid per cycle, while turbo machines operate dynamically.
- c) Positive displacement machines are more efficient at high speeds, while turbo machines are more efficient at low speeds.
- d) Positive displacement machines are only suitable for low-pressure applications, while turbo machines are used in high-pressure systems.

Answer: b) Positive displacement machines transfer a fixed volume of fluid per cycle, while turbo machines operate dynamically.

Explanation: Positive displacement machines, such as pumps, move a fixed volume of fluid per cycle, while turbo machines, like turbines and compressors, operate continuously and vary their output dynamically.

15. In a hydraulic press, what component is responsible for controlling the flow of hydraulic fluid?

- a) Hydraulic cylinder
- b) Control valve
- c) Accumulator
- d) Hydraulic pump

Answer: b) Control valve

Explanation: The control valve regulates the flow of hydraulic fluid to control the speed and direction of the hydraulic press's movements.
