Prove that $G = \{-1,1,i,-i\}$ is a group under multiplication.

First need to show that G is indeed closed under the operation *

we have 1*1=1 where $1 \in G$

we have -1*-1=1 where $1\in G$

we have 1*-1=-1 where $-1\in G$ and $-1*1=-1\in G$

we have 1*i=i and i*1=i where $i \in G$

we have -1*i=-i and i*-1=-i where $-i\in G$

let $k \in \mathbb{N}$ then i2k=-1 where $-1 \in \mathbb{G}$

Finally let $k \in \mathbb{N}$ then we have i2k+1=-i where $-i \in \mathbb{G}$

So, all possible outcomes from every combination of multiplication between any elements yields an element in G.
