

What is ER model ? What are the elements of ER model ? What are the notations of ER diagram ?

An entity relationship model (ER model) is a way of representing the entities and the relationships between the entities in order to create a database.

## Element/Notation of ER model/diagram:

### 1. Entity:

- Think of an entity as something in the real world that you can identify, like a person, place, or thing.
- It's a specific object that exists and is different from other objects.
- Entities can be concrete (like a person) or abstract (like an idea).

### 2. Entity Set:

- An entity set is just a collection or group of similar entities.
- For example, if "Person" is an entity, then the set of all people would be the "Person" entity set.

### 3. Attribute:

- Attributes are the characteristics or properties that describe an entity.
- If "Person" is an entity, then attributes could include things like "Name," "Age," or "Address."
- Attributes are like the details or features of an entity.

### 4. Relationship:

- Relationships show how entities are connected or associated with each other.
- Picture a relationship as a link between entities.
- For instance, if "Person" is an entity and "Works for" is a relationship, it could connect a person to a company entity.
