

What is Software ? What is the difference between a software process and a software product ?

What is software

A collection of computer programmes known as software also includes related documentation and data.

Software Process

Software production involves the full software process. It covers the complete software development process. It involves requirement analysis, software design, development, testing, documentation, and maintenance. Thus, the software product is the sum of its actions. The software process has every detail about the ultimate product from the start, which is what the programme would be like.

Software Product

Customers are given the software. It is created as a result of software development. Data, source code, user guides, reference manuals, installation instructions, specification papers, and miscellaneous paperwork, among other things. The software product has no information about how it was planned, how many people worked on it, how the labour was distributed, and so on. It's just a user-satisfied app.
