a. Data Store:

1. Definition: A data store is like a storage unit in a data flow diagram, holding data for future use.
2. Function: It doesn’t perform actions but responds to requests for storing and retrieving data.
3. Flexibility: Allows accessing values in a different order than generated.
4. Representation: Shown as parallel lines with the store’s name in between.
5. Arrows: Input arrows indicate operations modifying data, while output arrows show retrieved information.

b. Actors:

1. Definition: An actor is an active participant generating or consuming values in the data flow.
2. Attachment: Actors connect to the inputs and outputs of a data flow diagram.
3. Examples: Users, thermostats, or computer-controlled motors can be actors.
4. Representation: Drawn as rectangles, denoting them as objects. Arrows indicate inputs and outputs.

c. Control Flow:

1. Role: It helps show which paths are executed and in what order in a data flow diagram.
2. Inclusion: Control flows are added to illustrate Boolean values affecting process evaluation.
3. Nature: A control flow is a yes/no factor, not an input value to the process.
4. Representation: Displayed as dotted lines from a process producing a Boolean value to the controlled process.
